

Ex : 6**Risk Treatment and Risk Acceptance****Date: 31.07.2026****Aim:**

To identify appropriate risk treatment options and document the acceptance of residual risk using the Eramba dashboard.

Procedure :

Step 1: Log in to Eramba

1. Open your Eramba dashboard.
2. Log in using your Email and Password.
3. From the left menu, go to Risk Management.

Step 2: Open Risk Management

1. Select Asset Risks or Business Risks.
2. Click Add to create a new risk, or open an existing risk.

Example:

Field	Example
Risk Name	Unauthorized Access to Company Data
Asset	Company Database
Threat	Unauthorized user
Vulnerability	Weak access controls
Likelihood	Possible
Impact	High

Save the risk.

Step 3: Assess the Risk

Evaluate:

- Likelihood/Probability – how likely the risk is to occur.
- Impact – how serious the consequences would be.
- Risk Level – overall level calculated from likelihood and impact.

Example:

Likelihood = Possible

Impact = High

Overall Risk = High

Risk Treatment

Step 4: Select a Risk Treatment

Open the identified risk and select the appropriate treatment.

Common treatment options are:

1. Risk Avoidance – stop the activity causing the risk.
2. Risk Reduction/Mitigation – implement controls to reduce likelihood or impact.
3. Risk Transfer – transfer part of the risk to another party, such as insurance or outsourcing.
4. Risk Acceptance – consciously accept the risk without additional treatment.

Step 5: Apply a Control

For example, if you choose Risk Reduction:

Risk: Unauthorized access to company data

Treatment: Implement MFA and role-based access control.

In Eramba, associate the relevant control/countermeasure with the risk.

Example:

Risk	Treatment	Control
Unauthorized access	Reduce	MFA
Data loss	Reduce	Backup
Cyberattack	Transfer	Cyber insurance
Low-impact risk	Accept	Management acceptance

Save the treatment.

Risk Acceptance

Step 6: Determine Residual Risk

After implementing the treatment, reassess the risk.

Example:

Before treatment:

Likelihood = Likely

Impact = High

Risk = High

After MFA and access controls:

Likelihood = Unlikely

Impact = High

Residual Risk = Medium

The remaining risk is called residual risk.

Step 7: Accept the Residual Risk

If management decides that the remaining risk is within the organization's acceptable level:

1. Open the risk.
2. Go to the risk treatment/acceptance section.
3. Record the risk acceptance.
4. Enter the reason/justification.
5. Identify the person responsible for accepting the risk.
6. Add the acceptance/review date if available.
7. Save the record.

Example justification:

The residual risk is considered acceptable because the implemented security controls have reduced the likelihood of unauthorized access to an acceptable level.

Step 8: Review the Risk

Verify that:

- The original risk is documented.
- Treatment has been selected.
- Controls are associated with the risk.
- Residual risk has been assessed.
- Acceptance decision is documented.
- Risk owner/management responsibility is recorded.

Output:

The screenshot displays the Eramba web application interface. On the left is a sidebar menu with options: Organization, Asset Management (selected), Data Flows, Control Catalog, Risk Management, Compliance Manage..., Security Operations, and Settings. Below the menu is a notification: "You are running Eramba Community. Upgrade to Enterprise and reach the stars. Check it out". The main content area is titled "Assets" and has a "Reviews" tab. On the right, the "Add Item" form is open. It contains the following fields: "Related Business Units" (with "Healthcare Services" selected), "Name" (with "Unauthorized Access to Company Data" entered), "Description" (with "Company Database" entered), "ORC Contact" (with "Admin Admin" selected), "Asset Reviewer Contact" (with "Admin Admin" selected), and "Type" (with "IT Service" selected). At the bottom of the form are "Cancel" and "Save" buttons.

The screenshot shows the "Edit Action" dialog box with three tabs: "General", "Analysis" (selected), and "Treatment". Under the "Analysis" tab, there are three sections: "Likelihood (Analysis)" with a dropdown set to "Likelihood (Medium)" and a description "MAY OCCUR OCCASIONALLY"; "Impact (Analysis)" with a dropdown set to "Impact (Very High)" and a description "SEVERE BUSINESS IMPACT"; and a calculation section showing "2 + 4 = 6".

Result:

The identified risk was assessed and treated in Eramba by selecting an appropriate risk treatment, implementing controls, calculating residual risk, and documenting management acceptance of the remaining acceptable risk.
